Содержание

1. Highlights	3
2. Metrics	4
3. Incidents	5
4. Next week	6

Status for week 36, compiled Friday 17:00. Audience: engineering leadership.

Highlights

Shipped the context-compression rewrite; agent sessions now survive 200k+ token histories without drift. Rolling out to 10% of traffic on Monday.

Metrics

Metric	This week	Last week	Delta
Sessions/day	41 203	38 117	+8.1%
Median latency	2.4 s	2.9 s	-17%
p99 latency	11.8 s	9.2 s	+28% 
Cost/session	\$0.041	\$0.047	-12.8%

The p99 regression traces to the new evaluator shard — see Incidents.

Incidents

INC-2231 (Tue, 40 min): evaluator shard OOM under batch load; the compressor emits denser checkpoints than the shard's memory budget assumed.

```
# hotfix shipped Thursday
BATCH_SOFT_LIMIT = int(os.environ.get("EVAL_BATCH_SOFT_LIMIT",
256))
if len(pending) > BATCH_SOFT_LIMIT:
    flush(pending[:BATCH_SOFT_LIMIT])
    pending = pending[BATCH_SOFT_LIMIT:]
```

INC-2233 (Wed, 6 min): DNS blip, failover worked, no action.

Next week

1. Evaluator shard memory budget: +2 GB and a load test with dense checkpoints
2. Compression rewrite to 50% of traffic
3. Draft the p99 alert runbook (owner: N.)
