A Field Guide to E-Ink Typography

A tour of what remarkable-send does to a plain markdown file before it lands on a reMarkable tablet. Every feature below is exercised by this document.

Typography tuned for the panel

The page is exactly 157.7×210.3 mm — the reMarkable 2 screen at 226 dpi, edge to edge. Body text is a true 12 pt at 16 CSS px; margins are 13 mm sides and top, 15 mm at the bottom for the thumb. Nothing needs pinching, zooming or panning; one PDF page is one screen.

1. Pages sized 1:1 to the device — no fit-to-width scaling
2. 12 pt body with 1.55 leading — the e-ink legibility floor
3. Single column, ~65 characters per line
4. Pure black on white; no fills that ghost on partial refresh

On reading longform

The serif theme sets body text in Liberation Serif at 1.6 leading with hairline rules and small-caps labels. It reads like a typeset paperback: essays, interviews, book chapters — anything you will read for an hour rather than annotate.

On chapters

Every section opens its own page under a thin rule, the way a proper book does. Drop caps were tried and rejected: on a 16-gray panel restraint wins.

On the compact theme

For manuals and API references there is a third theme — 14 pt body, tighter leading, the same chrome. It packs roughly a fifth more words per page for the times a document must fit the flight, not the desk.

This sample was rendered with `--theme book`.
