The p99 regression traces to the new evaluator shard — see Incidents.

Incidents

INC-2231 (Tue, 40 min): evaluator shard OOM under batch load; the compressor emits denser checkpoints than the shard's memory budget assumed.

```
# hotfix shipped Thursday
BATCH_SOFT_LIMIT = int(os.environ.get("EVAL_BATCH_SOFT_LIMIT",
256))
if len(pending) > BATCH_SOFT_LIMIT:
    flush(pending[:BATCH_SOFT_LIMIT])
    pending = pending[BATCH_SOFT_LIMIT:]
```

INC-2233 (Wed, 6 min): DNS blip, failover worked, no action.

Next week

1. Evaluator shard memory budget: +2 GB and a load test with dense checkpoints
2. Compression rewrite to 50% of traffic
3. Draft the p99 alert runbook (owner: N.)
